

El vocabulario fundamental del español de México.

No hay un único procedimiento para descubrir el vocabulario fundamental de una lengua [7]. Roberto Ham Chande propuso considerar como tal la acumulación de los tres primeros cuartiles de frecuencias absolutas de los vocablos encontrados en el CEMC, que corresponden a 75% de todas las ocurrencias. Eso equivale a suponer que los vocablos encontrados con esas características se utilizan en el 75% de todas las emisiones verbales de los mexicanos. Cuando tomamos esa decisión sólo contábamos con los resultados de tipos, no con los de vocablos, por la razón dada antes. Los tipos del vocabulario fundamental que encontramos fueron 1,139. Del vocabulario de tradición culta encontramos 1,451; una vez estudiados esos tipos y elaborados los artículos correspondientes del diccionario, redujimos el vocabulario fundamental a 842 vocablos.

La lista siguiente corresponde al vocabulario fundamental del español de México ; en ella, al lado de cada vocablo, se ofrece su frecuencia absoluta, su frecuencia relativa entre los 14 géneros y las medidas de frecuencia corregida (KF), el cálculo intermedio de ponderación de la frecuencia corregida (S) y el índice normalizado de dispersión (C).

Hay que aclarar que las dos medidas más transparentes para cualquier usuario de estos resultados son las de frecuencia absoluta y las del índice normalizado de dispersión (C). La medida de KF presenta la dificultad de que varía según la frecuencia absoluta de cada vocablo, tomando como punto de partida su frecuencia más alta en alguno de los géneros, por lo que, si uno no dispone de la información detallada de los resultados de los 14 géneros, es muy difícil de ponderar [8]; S es sólo la fase previa del cálculo del índice normalizado de dispersión, por lo que no resulta informativa para la mayor parte de los lectores; en cambio, C, el índice normalizado de dispersión, tiene la ventaja de que pondera la frecuencia absoluta de cada vocablo en relación con las relativas en cada género –lo que da una primera medida de dispersión- y en relación con los diferentes valores cuantitativos de cada género, de donde reduce a un número entre cero y uno su dispersión: un vocablo que sea muy frecuente y muy bien repartido entre los catorce géneros, tiende a acercarse a uno (véase el vocablo abajo , por ejemplo); un vocablo, en cambio, de poca frecuencia y baja dispersión tiende al cero (tratándose del vocabulario fundamental, todos los valores ofrecidos tienen, lógicamente, un índice C cercano a uno [9]).
